DigitalFlow™ XGF868i

Flare Gas Mass Flow Ultrasonic Transmitter

Startup Guide
[no content intended for this page]
Information Paragraphs

**Note:** These paragraphs provide information that provides a deeper understanding of the situation, but is not essential to the proper completion of the instructions.

**IMPORTANT:** These paragraphs provide information emphasizing instructions which are essential to proper setup of the equipment. Failure to follow these instructions carefully may cause unreliable performance.

**WARNING!** Indicates a potentially hazardous situation which can result in serious personal injury or death, if it is not avoided.

**CAUTION!** Indicates a potentially hazardous situation which can result in minor or moderate injury to personnel or damage to the equipment, if it is not avoided.

**HIGH VOLTAGE!** This symbol indicates the presence of high voltage. It calls your attention to situations or operations that could be dangerous to you and other persons operating the equipment. Read these messages and follow the instructions carefully.

Safety Issues

**WARNING!** It is the responsibility of the user to make sure all local, county, state and national codes, regulations, rules and laws related to safety and safe operating conditions are met for each installation.

Auxiliary Equipment

Local Safety Standards

The user must make sure that he operates all auxiliary equipment in accordance with local codes, standards, regulations, or laws applicable to safety.

Working Area

**WARNING!** Auxiliary equipment may have both manual and automatic modes of operation. As equipment can move suddenly and without warning, do not enter the work cell of this equipment during automatic operation, and do not enter the work envelope of this equipment during manual operation. If you do, serious injury can result.

**WARNING!** Make sure that power to the auxiliary equipment is turned OFF and locked out before you perform maintenance procedures on the equipment.
Qualification of Personnel

Make sure that all personnel have manufacturer-approved training applicable to the auxiliary equipment.

Personal Safety Equipment

Make sure that operators and maintenance personnel have all safety equipment applicable to the auxiliary equipment. Examples include safety glasses, protective headgear, safety shoes, etc.

Unauthorized Operation

Make sure that unauthorized personnel cannot gain access to the operation of the equipment.

Environmental Compliance

Waste Electrical and Electronic Equipment (WEEE) Directive

GE Measurement & Control is an active participant in Europe’s *Waste Electrical and Electronic Equipment (WEEE)* take-back initiative, directive 2012/19/EU.

The crossed-out wheeled bin symbol invites you to use those systems.

If you need more information on the collection, reuse and recycling systems, please contact your local or regional waste administration.

Chapter 1. Installation

1.1 Introduction

To ensure safe and reliable operation of the XGF868i Ultrasonic Flow Transmitter, the system must be installed in accordance with the guidelines established by GE engineers. Those guidelines, which are explained in detail in this chapter, include the following specific topics:

- Unpacking the XGF868i system
- Selecting suitable sites for the electronics enclosure, the flowcell and the transducers
- Installing the flowcell and the transducers

Note: See the appropriate Transducer Installation Guide for detailed instructions on transducer installation.

- Installing optional temperature and pressure transmitters
- Installing the electronics enclosure
- Wiring the electronics enclosure

**WARNING!** The XGF868i flow transmitter can measure the flow rate of many gases, some of which are potentially hazardous. In such cases, observing the proper safety practices is critical. Be sure to follow all applicable local safety codes and regulations for installing electrical equipment and for working with hazardous gases or flow conditions. Consult company safety personnel or local safety authorities to verify the safety of any procedure or practice.

**ATTENTION EUROPEAN CUSTOMERS!**

To meet CE Mark requirements, all cables must be installed as described in Appendix A, CE Mark Compliance.

1.2 Unpacking

Carefully remove the electronics enclosure, the transducers, and the cables from the shipping containers. Before discarding any of the packing materials, account for all components and documentation listed on the packing slip. The discarding of an important item along with the packing materials is all too common. If anything is missing or damaged, contact the factory immediately for assistance.
1.3 Site Considerations

Because the relative location of the flowcell and the electronics enclosure is important, use the guidelines in this section to plan the XGF868i installation.

**WARNING!** Before beginning installation, please refer to “Installing GE Measurement & Control Ultrasonic Flow Transmitters in a Potentially Hazardous Area” near the back of this manual.

1.3.1 Electronics Enclosure Location

The standard XGF868i electronics enclosure is a powder-coated, cast-aluminum, Type-7/4X explosion-proof enclosure. An optional stainless steel enclosure is available. Typically, the enclosure is mounted as close as possible to the transducers. When choosing a site, make sure the location permits easy access to the electronics enclosure for programming, maintenance and service.

**IMPORTANT:** For compliance with the EU Low Voltage Directive (2006/95/EC), this unit requires an external power disconnect device such as a switch or circuit breaker. The disconnect device must be marked as such, clearly visible, directly accessible, and located within 1.8 m (6 ft) of the unit.

1.3.2 Flowcell Location

The pipeline flowcell consists of the flow rate transducers and any pressure and/or temperature transducers employed as part of the flow measurement system. Ideally, choose a section of pipe with unlimited access to the flowcell, such as a long stretch of pipe that is above ground. However, if the flowcell is to be mounted on an underground pipe, dig a pit around the pipe to facilitate installation of the transducers.

1.3.3 Transducer Location

For a given fluid and pipe, the accuracy of the XGF868i depends primarily on the location and alignment of the transducers. In addition to accessibility, when planning for transducer location, adhere to the following guidelines:

1. Locate the transducers so that there are at least 20 pipe diameters of straight, undisturbed flow upstream and 10 pipe diameters of straight, undisturbed flow downstream from the measurement point. To ensure undisturbed flow, avoid sources of turbulence in the fluid such as valves, flanges, expansions, elbows and dips or low spots in which condensed liquid may collect.

2. Because condensate or sediment at the bottom of the pipe may cause attenuation of the ultrasonic signal, locate the transducers on the side of a horizontal pipe, when possible. If limited pipe access necessitates top-mounted transducers and the sound beam path includes a reflection, shift the transducers to at least 10° off top dead center. This will minimize the influence of any sediment on the reflected ultrasonic signals.
1.3.4 Cable Lengths

Locate the electronics enclosure as close as possible to the flowcell and transducers, preferably directly on the flowcell. However, GE can supply transducer cables up to 1000 ft (300 m) in length for remote location of the electronics enclosure. If longer cables are required, contact GE for assistance.

1.3.5 Temperature and Pressure Transmitters

When installing temperature and/or pressure transmitters in the flowcell, locate them downstream of the transducers. These transmitters should be positioned no closer to the XGF868i transducers than 2 pipe diameters and no further away from the transducers than 20 pipe diameters.

1.3.6 Transducer Cables

When installing the transducer cables, always observe established standard practices for the installation of electrical cables. Specifically, do not route transducer cables alongside high-amperage AC power lines or any other cables that could cause electrical interference. Also, protect the transducer cables and connections from the weather and from corrosive atmospheres.

IMPORTANT: When using non-GE cables to connect the flow transducers to the XGF868i electronics enclosure, the cables must have electrical characteristics identical to the GE cables. Type RG62A/U coaxial cable should be used, and each cable must be the same length (within ±4 in.).

All interconnecting cables must comply with IEC/EN 60079-14.

1.4 Installing a Flowcell

A flowcell is the section of pipe upon which the transducers are mounted. It can be created either by mounting the transducers on the existing pipeline or by mounting them on a spoolpiece. A spoolpiece is a separately manufactured pipe section, matched to the existing pipe, which contains ports for mounting the transducers. This approach allows the transducers to be aligned and calibrated before inserting the spoolpiece into the pipeline.

Figure 6 on page 20 shows a typical right-angle mounting bracket for installing the XGF868i electronics enclosure. For detailed instructions on installing the transducers and the spoolpiece, refer to any supplied drawings and to the appropriate Transducer Installation Guide.
1.5 Installing Temperature and Pressure Transmitters

Optional temperature and pressure transmitters may be installed near the ultrasonic transducer ports as part of the flowcell. Be sure to observe the siting requirements given earlier in this chapter. These transmitters should send a 0/4-20 mA signal to the XGF868i. In turn, the XGF868i must be fitted with a suitable option card to process the signals and to provide the required 24 VDC power to the transmitters. Any desired transmitters or sensors may be used, but they must have an accuracy equal to ±0.5% of the reading or better.

Note: Resitive Thermal Devices (RTDs) are a good choice for measuring the temperature.

Typically, a 1/2” NPT or 3/4” NPT female threaded port is used to mount the transmitters on the flowcell. If the pipeline is insulated, the coupling may need to be extended to provide convenient access. Of course, other types of mounting ports, including flanged ports, may be used for the transmitters.

Figure 1 below shows a typical mounting arrangement for the pressure and temperature transmitters. The temperature sensor should extend into the pipe by 1/4 to 1/2 of the pipe inside diameter.

![Figure 1: Typical Temperature/Pressure Transmitter Mounting](image-url)
1.6 Mounting the XGF868i Electronics Enclosure

The standard XGF868i electronics package is housed in a Type-4X weather-resistant enclosure suitable for indoor or outdoor use. Refer to Figure 5 on page 19 for the mounting dimensions and the weight of this enclosure.

The XGF868i electronics enclosure is fitted with a mounting boss that has a single 3/4” NPT-F threaded hole at its center and four 1/4-20 tapped holes at its corners. By using this mounting boss, the electronics enclosure may be mounted by any of the typical techniques shown in Figure 6 on page 20.

**WARNING!** Proper grounding of the XGF868i chassis is required to prevent possible electric shock. See Detail A in Figure 6 on page 20 for the location of the chassis grounding screw.

1.7 Making the Electrical Connections

This section contains instructions for making all the necessary electrical connections to the XGF868i flow transmitter. Refer to Figure 7 on page 21 for a complete wiring diagram.

**WARNING!** Refer to Installing GE Measurement & Control Ultrasonic Flow Transmitters in a Potentially Hazardous Area near the rear of this manual for additional installation instructions.

Except for the power connector, all electrical connectors are stored on their terminal blocks during shipment and may be removed from the enclosure for more convenient wiring. Simply, feed the cables through the conduit holes on the side of the enclosure, attach the wires to the appropriate connectors and plug the connectors back onto their terminal blocks.

**WARNING!** To ensure safe and reliable operation of the XGF868i, be sure to install and tighten all cable glands in accordance with the gland manufacturer’s instructions.

**WARNING!** To meet CE Mark requirements, all cables must be installed as described in Appendix A, CE Mark Compliance.
1.7 Making the Electrical Connections (cont.)

**WARNING!** Always disconnect the line power from the XGF868i before removing either the front cover or the rear cover. This is especially important in a hazardous environment.

Refer to Figure 2 below and prepare the XGF868i for wiring by completing the following steps:

1. Disconnect any existing power line from its source.
2. Loosen the set screw on the rear cover.
3. Place a rod or long screwdriver across the cover in the slots provided, and rotate the cover counterclockwise until it comes free from the enclosure.
4. Install any required cable clamps in the appropriate conduit holes around the side of the enclosure.
5. Note the labels inside the rear cover to assist in wiring the power and option card connections. Also, Figure 8 on page 22 shows the rear cover option card labels for every available option card configuration.

Proceed to the appropriate section of this chapter to make the desired wiring connections.
1.7.1 Wiring the Line Power

The XGF868i may be ordered for operation with power inputs of 100-120 VAC, 220-240 VAC, or 12-28 VDC. The label on the side of the electronics enclosure lists the required line voltage and the power rating for the unit. Be sure to connect the meter only to the specified line voltage. The fuse size is listed in Table 1 below.

<table>
<thead>
<tr>
<th>Line Voltage</th>
<th>Fuse Rating</th>
</tr>
</thead>
<tbody>
<tr>
<td>85-250 VAC</td>
<td>Not field-replaceable (contact GE)</td>
</tr>
<tr>
<td>12-28 VDC</td>
<td>2.0 A, Slow-Blow</td>
</tr>
</tbody>
</table>

**IMPORTANT:** For compliance with the EU Low Voltage Directive (2006/95/EC), this unit requires an external power disconnect device such as a switch or circuit breaker. The disconnect device must be marked as such, clearly visible, directly accessible, and located within 1.8 m (6 ft) of the unit.

**Note:** Only use Class 2 Rated Power supply for line power connection to DC instrument.

Refer to Figure 7 on page 21 to locate terminal block TB5 and connect the line power as follows:

1. Prepare the line power leads by trimming the line and neutral AC power leads (or the positive and negative DC power leads) to a length 0.5 in. (1 cm) shorter than the ground lead. This ensures that the ground lead is the last to detach if the power cable is forcibly disconnected from the meter.

2. Install a suitable cable clamp in the conduit hole indicated in Figure 7 on page 21. If possible, avoid using the other conduit holes for this purpose, to minimize any interference in the circuitry from the AC power line.

**HIGH VOLTAGE!** Improper connection of the line power leads or connecting the meter to the incorrect line voltage may damage the unit. It may also result in hazardous voltages at the flowcell and associated piping as well as within the electronics enclosure.

**WARNING!** To meet CE Mark requirements, all cables must be installed as described in Appendix A, CE Mark Compliance.
Chapter 1. Installation

1.7.1 Wiring the Line Power (cont.)

3. Strip 1/4 in. of insulation from the end of each of the three power line leads.

4. Route the cable through the conduit hole and connect the line power leads to terminal block TB5, using the pin number assignments shown in Figure 7 on page 21.

5. Leaving a bit of slack, secure the power line with the cable clamp.

WARNING! Make sure that both covers with the o-ring seals are installed and the set screws are tightened before applying power to the unit in a hazardous environment.

CAUTION! The transducers must be properly wired before applying power to the meter.

1.7.2 Wiring the Transducers and Preamplifiers

Before wiring the XGF868i transducers and preamplifiers, complete the following steps:

• Disconnect the main power from the electronics enclosure
• Remove the rear cover and install all required cable clamps

The electronics enclosure may be located either directly on the flowcell (local) or some distance away from the flowcell (remote). The preamplifiers may be located either in the transducer junction boxes (local) or some distance away from the transducers in their own separate enclosures (remote). Based on the specific configuration of your system, proceed to one of the following sections for detailed instructions:

• Local or Remote electronics enclosure with Local preamplifiers (see Section 1.7.2a on page 9)
• Local or Remote electronics enclosure with Remote preamplifiers (see Section 1.7.2b on page 10)
1.7.2a Local or Remote Electronics Enclosure with Local Preamplifiers

**WARNING!** Before connecting the transducers, take them to a safe area and discharge any static buildup by shorting the center conductor of the transducer cables to the metal shield on the cable connector.

**IMPORTANT:** The cable lengths for a given pair of transducers, including the preamplifier-to-electronics enclosure cables, must be equal to within ±4 in. (10 cm) of each other.

For an XGF868i system configured with either a local or remote electronics enclosure and local preamplifiers, wire the transducers and preamplifiers as follows:

1. The local preamplifier must be installed in the junction box on the end of the transducer. Connect the BNC cable with the mating connector from the preamplifier to the transducer BNC connector.

2. Locate the two CH1 preamplifier-to-electronics enclosure cables and connect one to each of the two CH1 preamplifiers in the junction boxes, using the remaining preamplifier connections. Then, feed the free ends of the cables through the selected conduit holes in the electronics enclosure.

3. See Figure 7 on page 21 for the location (J3) of the connections for the Channel 1 transducers in the electronics enclosure. Then, refer to Figure 10 on page 24 to wire the transducer to preamplifier and preamplifier to electronics enclosure connections.

   **Note:** The RED cable leads are the SIG(+) leads and the BLACK cable leads are the RTN(-) leads.

   **ATTENTION EUROPEAN CUSTOMERS!**
   To meet CE Mark requirements, all cables must be installed as described in Appendix A, CE Mark Compliance.

4. For a 2-Channel XGF868i, repeat steps 1-3 to connect the CH2 transducers to terminal block J4 in the electronics enclosure. Note that it is not required that both channels of a 2-channel unit be connected.

5. If wiring of the system has been completed, reinstall the rear cover and o-ring on the electronics enclosure and tighten the set screw.

   **Note:** A channel must be activated in the Channel Menu before it can begin taking measurements. See Chapter 2, Initial Setup, for instructions.
1.7.2b Local or Remote Electronics Enclosure with Remote Preamplifiers

**WARNING!** Before connecting the transducers, take them to a safe area and discharge any static buildup by shorting the center conductor of the transducer cables to the metal shield on the cable connector.

**IMPORTANT:** The cable lengths for a given pair of transducers, including the preamplifier-to-electronics enclosure cables, must be equal to within ±4 in. (10 cm) of each other.

**Note:** A dual preamplifier is typically used in these installations, and you must note the labeled upstream and downstream connections on the preamplifier. Be sure to connect the upstream transducer to the upstream connection on the preamplifier and in the XGF868i electronics enclosure. Follow the same procedure for the downstream connections.

The remote preamplifier (PRE868) uses a transformer (p/n 705-603) which connected to the "XDCR" BNC connector on the preamplifier (see Figure 9 on page 23).

For an XGF868i system configured with either a local or remote electronics enclosure and a dual remote preamplifier, wire the transducers and preamplifier as follows:

1. Refer to Figure 9 on page 23 and use the pair of coaxial cables with BNC to BNC connectors supplied by GE (or equivalent cables) to connect both CH1 transducers to the dual preamplifier, using the connections on the transformer.

**CAUTION!** As part of maintaining the FM/CSA environmental rating (TYPE 4) on the remote preamplifier, thread sealant is required on all conduit entries.

2. If an optional lightning protector is installed, connect it between the preamplifier and the electronics enclosure. Locate the device near the electronics enclosure and install it according to the supplied wiring documentation for the device.

3. See Figure 7 on page 21 for the location (J3) of the connections for the Channel 1 transducers in the electronics enclosure. Using the supplied coaxial cables with BNC to flying lead connectors (or equivalent cables), route the cables through one of the conduit holes in the electronics enclosure and connect the preamplifier to terminal block J3. Secure the cables with the cable clamp.

**Note:** The RED cable leads are the SIG(+) leads and the BLACK cable leads are the RTN(-) leads.
1.7.2b  Local or Remote Electronics Enclosure with Remote Preamplifiers (cont.)

ATTENTION EUROPEAN CUSTOMERS!
To meet CE Mark requirements, all cables must be installed as described in Appendix A, CE Mark Compliance.

4. For a 2-Channel XGF868i, repeat steps 1-3 to connect the CH2 transducers to terminal block J4 in the electronics enclosure. Note that it is not required that both channels of a 2-channel unit be connected.

5. If wiring of the system has been completed, reinstall the rear cover and o-ring on the electronics enclosure and tighten the set screw.

Note: A channel must be activated in the Channel Menu before it can begin taking measurements. See Chapter 2, Initial Setup, for instructions.

1.7.3  Wiring Std 0/4-20 mA Analog Outputs

The standard configuration of the XGF868i flow transmitter includes two isolated 0/4-20 mA analog outputs (designated as outputs 1 and 2). Connections to these outputs may be made with standard twisted-pair wiring, but the current loop impedance for these circuits must not exceed 600 ohms.

To wire the analog outputs, complete the following steps:

1. Disconnect the main power and remove the rear cover.

2. Install the required cable clamp in the chosen conduit hole on the side of the electronics enclosure.

3. Refer to Figure 7 on page 21 for the location of terminal block J1 and wire the analog outputs as shown. Secure the cable clamp.

Note: Analog outputs 1 and 2 in the wiring diagram correspond to analog outputs A and B in Slot 0 in the XGF868i software.

WARNING! To meet CE Mark requirements, all cables must be installed as described in Appendix A, CE Mark Compliance.

4. If wiring of the unit has been completed, reinstall the rear cover on the enclosure and tighten the set screw.

WARNING! Make sure that both covers with the o-ring seals are installed and the set screws are tightened before applying power to the unit in a hazardous environment.

Note: Prior to use, the analog outputs must be set up and calibrated. See Chapter 1, Calibration, of the Service Manual for detailed instructions.
1.7.4 Wiring the Serial Port

The XGF868i flowmeter is equipped with an RS232 serial interface. The serial port is used to transmit stored data and displayed readings to a personal computer by connecting the meter’s serial interface to the serial port of the PC. In addition, the XGF868i can receive and execute remote commands, using the Instrument Data Manager or PanaView software via this link.

For more information on serial communications refer to your EIA-RS Serial Communications manual (916-054). Proceed to the appropriate sub-section for wiring instructions.

**WARNING!** To meet CE Mark requirements, all cables must be installed as described in Appendix A, CE Mark Compliance.

1.7.4a Wiring the RS232 Interface

Use the serial port to connect the XGF868i flow transmitter to a printer, an ANSI terminal or a personal computer. The RS232 interface is wired as Data Terminal Equipment (DTE). Table 2 below lists the standard cables available from the factory for this purpose.

<table>
<thead>
<tr>
<th>Part Number</th>
<th>PC Connector</th>
<th>XGF868i Connector</th>
</tr>
</thead>
<tbody>
<tr>
<td>704-659</td>
<td>DB-25 Male</td>

<td>DB-25 Female</td>
<td>Flying Leads (5)</td>
</tr>
<tr>
<td>704-662</td>
<td>DB-9 Female</td>
<td>Flying Leads (5)</td>
</tr>
</tbody>
</table>

Each of the cables listed in the table above is available in several standard lengths. However, a user-supplied cable may be used, if preferred. In either case, wire the XGF868i end of the serial cable in accordance with the pin designations listed in Table 3 on page 13.
1.7.4a Wiring the RS232 Interface (cont.)

Refer to Figure 7 on page 21 to complete the following steps:

**HIGH VOLTAGE!** Dangerous voltages exist within the electronics enclosure. Do not attempt to wire the unit until the main power has been disconnected.

1. Disconnect the main power and remove the rear cover.

**WARNING!** The XGF868i must be moved to a safe environment before removing either cover.

2. Install the required cable clamp in the chosen conduit hole on the side of the electronics enclosure.

3. Use the information in Table 3 below to construct a suitable cable for connecting the XGF868i to the external device. If desired, an appropriate cable may be purchased from GE.

4. Feed the cable’s flying leads through the conduit hole and wire it to terminal block J1. Connect the other end of the cable to the external serial device and secure the cable clamp.

After the wiring has been completed, consult the User’s Manual for the external device to configure it for use with the XGF868i.
1.7.5  Wiring the Option Cards

The XGF868i can accommodate one option card in Slot 1 and one option card in Slot 2. The following option card functions are available only in the combinations listed in Table 13 on page 61:

- Analog Inputs (Slot 1)
- Totalizer/Frequency Outputs (Slot 1)
- RTD Inputs (Slot 1)
- Analog Outputs (Slot 1)
- MODBUS Communications (Slot 2)
- MODBUS/TCP Communications (Slot 2)
- Ethernet (Slot 2)
- Foundation Fieldbus (Slot 2)
- Data Logging (Slot 2) - no wiring required

Wiring any option card installed in Slot 1 requires completion of the following general steps:

1.7.5a  Preparing for Wiring

1. Disconnect the main power and remove the rear cover.
2. Install a cable clamp in the chosen conduit hole on the side of the electronics enclosure and feed a standard twisted-pair cable through this conduit hole.
3. Locate the 12-pin terminal block (J2) in Figure 7 on page 21 and wire the option card as indicated on the label inside the rear cover (see Figure 2 on page 6 and Figure 8 on page 22). Secure the cable clamp.

**IMPORTANT:** Because of the attached wiring label, all rear covers must remain with their original meters.

**WARNING!** To meet CE Mark requirements, all cables must be installed as described in Appendix A, CE Mark Compliance.

4. If wiring of the unit has been completed, reinstall the rear cover on the enclosure and tighten the set screw.

**Note:** Prior to use, the option card must be set up and calibrated. See Chapter 1, Programming Site Data, in the Programming Manual and Chapter 1, Calibration, in the Service Manual for detailed instructions.

For more specific instructions on particular option cards, proceed to the appropriate section(s) that follow.
1.7.5b  Wiring a 0/4-20 mA Analog Inputs Option Card

To calculate the standard flow rates, the XGF868i requires accurate temperature and pressure data from the measurement site. Transmitters installed in the flowcell can provide this information via an optional 0/4-20 mA analog inputs option card. This option card includes two or four isolated 0/4-20 mA analog inputs (designated as A, B, C and D), each of which includes a 24 VDC power supply for loop-powered transmitters. Either input may be used to process the temperature signal, while the other input is used to process the pressure signal.

Note: To properly enter programming data into the meter, it is necessary to know which input is assigned to which process parameter. This information should be entered in Appendix B, Data Records.

The analog inputs, which have an impedance of 118 ohms, should be connected with standard twisted-pair wiring. Power to the transmitters may be supplied either by the integral 24 VDC power supply on the analog input option card or by an external power supply. Figure 3 below shows typical wiring diagrams, with and without an external power supply, for one of the analog inputs.

![Figure 3: Analog Input Wiring Diagram](image)
1.7.5b  Wiring a 0/4-20 mA Analog Inputs Option Card (cont.)

Before making any connections, complete the steps in Preparing for Wiring on page 14. Wire the analog inputs as shown on the label in the rear cover (see Figure 8 on page 22).

**Note:** The analog inputs option card can be calibrated with the XGF868i built-in analog outputs. However, be certain that the analog outputs have been calibrated first. See Chapter 1, Calibration, in the Service Manual for the appropriate procedures.

1.7.5c  Wiring a Totalizer/Frequency Outputs Option Card

Each totalizer/frequency outputs option card provides two or four outputs (designated as A, B, C, and D) that can be used as either totalizer or frequency outputs.

Before making any connections, complete the steps in Preparing for Wiring on page 14. Then, wire this option card in accordance with the connections shown on the label in the rear cover (see Figure 2 on page 6 and Figure 8 on page 22). Figure 4 below shows sample wiring diagrams of a totalizer output circuit and a frequency output circuit. Refer to “Optional Inputs and Outputs” on page 55 for load and voltage requirements.

![Figure 4: Totalizer/Frequency Outputs Wiring](image-url)
1.7.5d  Wiring an RTD Inputs Option Card

The XGF868i RTD (Resistance Temperature Device) inputs option card provides two or four direct RTD inputs (designated as A, B, C and D). Each RTD input requires three wires, and should be connected as shown on the label in the rear cover (see Figure 2 on page 6 and Figure 8 on page 22).

Note: Before making any connections, complete the steps in Preparing for Wiring on page 14.

1.7.5e  Wiring a 0/4-20 mA Analog Outputs Option Card

The analog outputs option card includes two isolated 0/4-20 mA outputs (designated as A and B). Connections to these outputs may be made with standard twisted-pair wiring, but the total current loop impedance for these circuits must not exceed 1000 ohms.

Before making any connections, complete the steps in Preparing for Wiring on page 14. Then, wire this option card with the connections shown on the label in the rear cover (see Figure 2 on page 6 and Figure 8 on page 22).

1.7.5f  A Specific Example

To illustrate the procedures described in the previous sections for wiring the option cards, a specific example may prove helpful. Assume that an XGF868i is equipped with an option card numbered 703-1223-08. Table 13 on page 61 in Appendix B, Data Records, indicates that this option card includes two analog current inputs and two standard alarm relays.

1.7.5g  Wiring the MODBUS/TCP Interface

Customers can also use a modified XGF868i that provides a MODBUS/TCP interface to communicate to an internal network. An optional MODBUS/TCP card with a unique MAC (IP) address (installed only in slot 2) includes an RJ45 connector. To connect the MODBUS/TCP-enabled XGF868i to the network, insert the jack of an RJ45 cable into the RJ45 connector, route the cable through one of the conduit holes using an appropriate cable clamp, and wire the other end of the cable to the Ethernet network according to the manufacturer’s instructions (see Figure 11 on page 25).

Note: The MAC address for a specific XGF868i is included with customer documentation. For more information on setting up the MAC address, refer to Chapter 6 of the Programming Manual.
1.7.5h  Wiring the Ethernet Interface

A modified XGF868i can use the Ethernet interface to communicate to a local area network. An optional Ethernet card with a unique MAC (IP) address (installed only in slot 2) includes an RJ45 connector. To connect the Ethernet-enabled XGF868i to the network, insert the jack of an RJ45 cable into the RJ45 connector, route the cable through one of the conduit holes using an appropriate cable clamp, and wire the other end of the cable to the Ethernet network according to the manufacturer’s instructions. An external connection is required between the Ethernet option card and the XGF868i RS232 connector, as shown in Table 4 below and Figure 11 on page 25.

**Note:** The MAC address for a specific XGF868i is included with the customer documentation. For more information on setting up the MAC address, refer to Appendix C of the Programming Manual.

1.7.5i  Wiring the Foundation Fieldbus Interface

To connect the Foundation Fieldbus interface to the XGF868i, make the network connections at J8, pins 1 and 2, as shown in drawing Y of Figure 11 on page 25. As an option, you can connect a shield to J8 pin 3, depending on the network wiring.

No connections are made to J9 under normal operation. If you need to reset the network board to factory defaults:

1. Connect a jumper between J9 pin 2 and J9 pin 3.
2. Power cycle (i.e., turn off and on) the XGF868i.
3. Ten seconds after the power has been restored to the XGF868i, remove the jumper to return the network board to normal operation.

**WARNING!** Make sure that both covers with the o-ring seals are installed and the set screws are tightened before applying power to the unit in a hazardous environment.

Chapter 2. Initial Setup

2.1 Introduction

This chapter provides instructions for programming the minimum amount of data required to place the XGF868i flowmeter into operation. Before the XGF868i can begin taking measurements and displaying valid data, the current system and pipe parameters must be entered. In addition, a 2-Channel meter requires that each channel be activated prior to use. Additional programming options provide access to the more advanced features of the XGF868i, but this information is not required to begin taking measurements.

Refer to the Programming Manual for information on programming all other features. Be sure to record all programming data in Appendix B, Data Records.

As a guide in following the programming instructions in this chapter, the relevant portions of the XGF868i menu map have been reproduced in Figure 13 on page 39.

2.2 Programming Methods

Note: See the Programming Manual for information on those User Program features not covered in this chapter.

You can program the XGF868i via either the keypad on the lower part of the glass enclosure, or PanaView™, a GE PC-based, non-resident software program that communicates with the XGF868i via its RS232 serial port. PanaView supplements basic XGF868i functions with several additional capabilities. With PanaView, you can:

- Load and save site file data
- Create and save graph and log files
- Display text output and graphs of live measurement data
- Create custom templates for displaying text, graph and log data
- Interface with multiple GE instruments.

This chapter focuses on programming via the keypad. For information on programming the XGF868i via PanaView, refer to Appendix C of the Programming Manual.
2.3 The XGF868i Keypad

Keypad Program

Along with the 2-line, 16-character LCD, the XGF868i includes a 6-key magnetic keypad. The decal cutout for each key contains a hall effect sensor, pushbutton switch and visible red LED. The magnetic wand used to activate a magnetic key is found attached to the meter chassis below the front panel. An operator activates the key by pressing the magnetic wand up to the glass lid over the desired key. The LED will light indicating a successful key press.

**Note:** The pushbutton switch will also act as a key press but is done with the glass lid open. Do not use the pushbutton switch in a hazardous area where the lid needs to be installed.

Use the magnetic keypad to navigate through the user program. The menu map may be followed in sequence, or the four arrow keys may be used to scroll through the prompt screens. Figure 12 shows the front of the XGF868i, with magnetic keypad and magnetic wand.

![Figure 12: XGF868i Magnetic Keypad and Wand](image)

**IMPORTANT:** The XGF868i keypad enables programming of the instrument through the glass faceplate without removing the cover. Thus, all programming procedures may be performed while the unit is installed in a hazardous area.

Six keys on the keypad enable users to program the XGF868i:

- `[Enter]` - confirms choice of a specific option and data entry within the option
- `[Escape]` - allows users to exit from a specific option without entering unconfirmed data
- `[]` and `[]` - enable users to view a specific measurement in the Key display setting or to scroll through a list of options (letters and numbers 0-9 as well as the negative sign and decimal point) in a menu
- `[<<]` and `[>]` - enable users to scroll to a specific option, among choices in an option, or to a character in a text entry.
### 2.3 The XGF868i Keypad (cont.)

When you power up the XGF868i, the display first shows the model and software version:

```
GE
XGF868i Y4DF.STD
```

The meter then starts to display measured parameters.

```
CH1  VEL  E1
10.00  Ft/s
```

To enter the Keypad Program, press the [Escape] key, followed by the [Enter] key, and the [Escape] key again. Each successive key must be entered within 10 seconds of the prior key.

As a guide in following the programming instructions in this chapter, the relevant portions of the Model XGF868i menu map have been reproduced in Figure 13 on page 39. Proceed to the following sections to enter data in the Channel or GLOBL menus.

**IMPORTANT:** If the keypad has not been pressed for 10 minutes, the XGF868i exits the Keypad Program and returns to displaying measurements. The meter retains any configuration changes that were confirmed with the [Enter] key, and restarts as if the operator had completed the programming cycle.
2.4  Entering Data in the GLOBL Menu

To begin programming your meter, you must select the system units from the GLOBL menu as discussed below. Refer to Figure 13 on page 39 and remember to record all programming data in Appendix B, Data Records.

Note: Refer to the Programming Manual for information on the other submenus in the GLOBL menu.

2.4.1 Entering Global System Data

The GLOBL-SYSTM submenu is used to enter several general system parameters (e.g., English or metric units). For units with 2 channels, this menu is also used to compute parameters such as the sum, difference or average of the channel 1 and channel 2 signals. When calculating the SUM, DIF or AVE readouts, data from the GLOBL-SYSTM submenu is used. Any conflicting data entered in the CHANNEL-SYSTM submenu is overridden.

1. In the Keypad Program, scroll to PROG and press [Enter].
2. In the PROG menu, scroll to GLOBL and press [Enter].
3. In the Global PROGRAM menu, scroll to SYSTM and press [Enter].
4. Scroll to the desired System Units selection (either metric or English) and press [Enter]. The XGF868i will display all parameters and measurements in the designated units.
5. Scroll to the desired Pressure Units selection (absolute or gauge) and press [Enter].
6. Do one of the following:
   • If PSIa (absolute) was selected, proceed to Step 7.
   • If PSIg (gauge) was selected, enter the desired atmospheric pressure, press [Enter] and proceed to Step 7.
7. Do one of the following:
   • For a single-channel XGF868i, the program returns to the Global PROGRAM menu.
   • For a 2-channel meter, proceed to the next page.
2.4.1a Selecting Volumetric Units

1. Scroll to the desired Volumetric Units for the flow rate display and press [Enter]. Table 5 below lists the available volumetric units.

<table>
<thead>
<tr>
<th>English</th>
<th>Metric</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACF = Actual Cubic Feet</td>
<td>ACM = Actual Cubic Meters</td>
</tr>
<tr>
<td>KACF = Thousands of ACF</td>
<td>KACM = Thousands of ACM</td>
</tr>
<tr>
<td>MMACF = Millions of ACF</td>
<td>MMACM = Millions of ACM</td>
</tr>
<tr>
<td>SCF = Standard Cubic Feet</td>
<td>SCM = Standard Cubic Meters</td>
</tr>
<tr>
<td>KSCF = Thousands of SCF</td>
<td>KSCM = Thousands of SCM</td>
</tr>
<tr>
<td>MMSCF = Millions of SCF</td>
<td>MMSCM = Millions of SCM</td>
</tr>
</tbody>
</table>

2. Scroll to the desired unit of Volumetric Time (from seconds to days), and press [Enter].

3. Scroll to the desired number of Vol Decimal Digits (digits to the right of the decimal point) in the volumetric flow display, and press [Enter].

2.4.1b Selecting Totalizer Units

4. Scroll to the desired Totalizer Units for the flow rate display and press [Enter]. Available units are listed in Table 5 above.

5. Scroll to the desired number of Tot Decimal Digits (digits to the right of the decimal point in the totalized flow rate display) and press [Enter].

6. Do one of the following:
   - If MASS FLOW is ON, proceed to Selecting Mass Flow Units on page 32.
   - If MASS FLOW is OFF, the meter returns to the Global PROGRAM window. Press [Escape] twice and proceed to Chapter 3, Operation, or the Programming Manual.

Note: To activate mass flow, see Activating Mass Flow in Chapter 1 of the Programming Manual. The following prompts appear only if mass flow is activated for both channels.
2.4.1c Selecting Mass Flow Units

1. Scroll to the desired *Mass Flow* units for the flow rate display and press [Enter]. The available units for this prompt, which are determined by the selection made at the *System Units* screen, are shown in Table 6 below.

<table>
<thead>
<tr>
<th>English</th>
<th>Metric</th>
</tr>
</thead>
<tbody>
<tr>
<td>LB = Pounds</td>
<td>Kilograms</td>
</tr>
<tr>
<td>KLB = Thousands of LB</td>
<td>Metric Tons (1000 KG)</td>
</tr>
<tr>
<td>MMLB = Millions of LB</td>
<td></td>
</tr>
<tr>
<td>Tons (2000 LB)</td>
<td></td>
</tr>
</tbody>
</table>

2. Scroll to the desired *Mass Flow Time* units for the mass flow rate display (from seconds to days) and press [Enter].

3. Scroll to the desired number of *Mdot Dec. Digits* (digits to the right of the decimal point in the mass flow rate display) and press [Enter].

4. Scroll to the desired *Mass (Totalizer)* units for the totalized mass flow rate display and press [Enter]. The available units for this prompt are determined by the selection made at the *System Units* prompt.

5. Scroll to the desired number of *Mass Dec. Digits* (digits to the right of the decimal point in the totalized mass flow rate display) and press [Enter].

6. Enter the *Molecular Weight (Mw)* and press [Enter].

7. After completing the above steps, the XGF868i returns to the Global PROGRAM window. Press [Escape] and scroll to CH1 or CH2 to continue setup programming.
2.5 Activating a Channel

The Channelx-ACTIV submenu permits selection of the desired measurement method. In addition, it is used to activate/deactivate one or both of the channels in a 2-Channel XGF868i.

To access the Channelx-ACTIV submenu:

1. From the Keypad Program, scroll to CH1 or CH2 and press [Enter].
2. In the Channel PROGRAM menu, scroll to ACTIV and press [Enter].
3. Scroll to Burst to activate the channel/path, and press [Enter].
4. Scroll to one of the measurement methods described below and press [Enter].
   - Skan Only is the preferred technique for locating the acoustic signal and for high velocity measurements. It is more robust in a noisy environment than the Measure technique.
   - Skan/Measure is the preferred technique to use for low velocity measurements.

If Skan Only is selected at the above prompt, the meter uses this technique exclusively. However, if Skan/Measure is selected, the meter uses Skan Only to find the acoustic signal and then tries to use the Skan/Measure technique for the actual measurement.

After completing the above step, the meter returns to the Channel PROGRAM window. Proceed to the next section to continue programming your meter.
2.6 Entering System Data for the Channel

The Channelx-System submenu is used to enter system parameters for the channel.

2.6.1 Accessing the Channelx-System Submenu

1. From the Channel PROGRAM menu, scroll to SYSTM and press [Enter].
2. The first prompt asks for the Channel Label. Use the four scrolling keys to enter the desired label (in any numeric or text combination up to five characters), and press [Enter].
3. The next prompt asks for the Channel (Site) Message. Enter the desired text in the same manner as the channel label with up to 15 characters, and press [Enter].

2.6.2 Selecting Volumetric Units

1. Scroll to the desired Volumetric Units for the flow rate display and press [Enter]. The available units are listed in Table 7 below.
2. Scroll to the desired Volumetric Time units for the flow rate display (from seconds to days) and press [Enter].
3. Scroll to the desired number of Vol Decimal Digits (digits to the right of the decimal point in the volumetric flow rate display) and press [Enter].

<table>
<thead>
<tr>
<th>Table 7: Available Volumetric/Totalizer Units</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>English</strong></td>
</tr>
<tr>
<td>ACF = Actual Cubic Feet</td>
</tr>
<tr>
<td>KACF = Thousands of ACF</td>
</tr>
<tr>
<td>MMACF = Millions of ACF</td>
</tr>
<tr>
<td>SCF = Standard Cubic Feet</td>
</tr>
<tr>
<td>KSCF = Thousands of SCF</td>
</tr>
<tr>
<td>MMSCF = Millions of SCF</td>
</tr>
</tbody>
</table>

2.6.3 Selecting Totalizer Units

1. Scroll to the desired Totalizer Units for the totalized flow rate display and press [Enter]. Available units are listed in Table 7 above.
2. Scroll to the desired number of Tot Decimal Digits (digits to the right of the decimal point in the totalized flow rate display) and press [Enter].
3. Do one of the following:
   * If MASS FLOW is ON, proceed to Selecting Mass Flow Units on page 35.
   * If MASS FLOW is OFF, the meter returns to the Channel PROGRAM window. Proceed to Entering Transducer and Pipe Parameters on page 35.

Note: To activate mass flow, see Activating Mass Flow in Chapter 1 of the Programming Manual.
2.6.4 Selecting Mass Flow Units

1. Scroll to the desired Mass Flow units for the flow rate display and press [Enter]. The available units for this prompt are determined by the selection made at the System Units prompt. See Table 8 below.

<table>
<thead>
<tr>
<th>Table 8: Available Mass Flow Units</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>English</strong></td>
</tr>
<tr>
<td>LB = Pounds</td>
</tr>
<tr>
<td>KLB = Thousands of LB</td>
</tr>
<tr>
<td>MMLB = Millions of LB</td>
</tr>
<tr>
<td>Tons (2000 LB)</td>
</tr>
</tbody>
</table>

2. Scroll to the desired Mass Flow Time units for the mass flow rate display and press [Enter].

3. Scroll to the desired number of Mdot Decimal Digits (digits to the right of the decimal point in the mass flow rate display) and press [Enter].

4. Scroll to the desired Mass (Totalizer) units for the totalized mass flow rate display and press [Enter]. The available units for this prompt are determined by the selection made at the System Units prompt.

5. Scroll to the desired number of Mass Dec. Digits (digits to the right of the decimal point in the totalized mass flow rate display) and press [Enter].

After completing the above steps, the XGF868i returns to the Channel PROGRAM window. Proceed to the next section to program transducer and pipe parameters.

2.7 Entering Transducer and Pipe Parameters

Enter the transducer and pipe parameters via the PIPE submenu.

1. From the Channel PROGRAM menu, scroll to the PIPE option and press [Enter].

2. The first prompt asks for the Transducer Number:

   • For a standard transducer, use the arrow keys to enter the number engraved on the transducer head, and press [Enter].

   • If there is no number engraved on the transducer head, press the right arrow key to scroll to the STD option, and use the up and down arrow keys to change to SPEC. Then use the arrow keys to enter an assigned number (from 91 to 99), and press [Enter].

   **IMPORTANT:** Special transducers, which have no engraved number on the head, are rarely used. Examine the transducer head carefully for a number.

   • If you entered the number for a standard transducer, proceed to the Pipe OD prompt in step 5.

   • If you entered the number for a special transducer, proceed to step 3 on the next page.
2.7.1 Special Transducers

3. Scroll to the transducer Frequency (supplied by the factory) and press [Enter].

**Note:** The frequency is required to transmit an excitation voltage at the transducer's natural frequency.

4. Enter the special transducer Tw (time delay) value (supplied by the factory) and press [Enter].

Tw is the time required for the transducer signal to travel through the transducer and its cable. This time delay must be subtracted from the transit times of the upstream and downstream transducers to ensure an accurate measurement.

2.7.2 Pipe Data

If either a standard or a special transducer is being used, the programming sequence should be rejoined at this point.

5. To select the appropriate Pipe OD Unit type from the list shown in Table 9 below, scroll to the right side of the screen, and use the up and down arrow keys to step through the list. Press [Enter]. Then use the arrow keys to enter the known pipe outside diameter or circumference on the left side and press [Enter].

Obtain the required information by measuring either the pipe outside diameter (OD) or circumference at the transducer installation site. The data may also be obtained from standard pipe size tables found in *Sound Speeds and Pipe Size Data* (914-004).

| Table 9: Available Pipe OD Units |
|-------------------------------|-----------------------------|
| English                       | Metric                     |
| inch                          | mm = millimeters           |
| feet                          | m = meters                 |
| in/PI = pipe circumference in inches | mm/PI = pipe circumference in millimeters |
| ft/PI = pipe circumference in feet | m/PI = pipe circumference in meters |

6. Use the arrow keys to enter the known Pipe Wall Thickness (in inches or mm) and press [Enter]. If the pipe wall thickness is not available, look up the value in a table of standard pipe size data which can be found in the *Sound Speeds and Pipe Size Data* manual (914-004).
2.7.3  Path and Axial Lengths

7. To enter the *Path Length*:
   a. Use the [>] arrow key to highlight the path length unit type at the right of the screen. Then use the [△] and [▽] arrow keys to scroll to the desired unit type.
   b. Use the [<] arrow key to return to the numeric entry on the left, and enter the path length of the ultrasonic signal. Press [Enter].

   **Note:** If a spoolpiece was ordered with the meter, the transducer signal path length \( P \) and the transducer signal axial length \( L \) are engraved on the flowcell and/or are included in the documentation supplied with the meter. For on-site transducer installations, refer to Appendix C, Measuring \( P \) and \( L \) Dimensions.

8. In the same manner, enter the appropriate *Axial Length L* unit type and axial length of the ultrasonic signal, and press [Enter].

9. Scroll to the desired *Fluid Type* and press [Enter]. Then do one of the following:
   - If OTHER was selected - proceed to Step 10.
   - If AIR was selected - proceed to Step 11.

10. Use the arrow keys to enter the *Fluid Soundspeed* (in feet per second) in the gas to be measured and press [Enter].

11. Scroll to the appropriate choice to indicate whether you want *Reynolds Correction*, and press [Enter].
   - If Off is selected, go to Step 12.
   - If On is selected, the program asks for the *Kinematic Viscosity*. Use the arrow keys to enter the desired value, and press [Enter].

12. Use the arrow keys to enter a value for the flow *Calibration Factor* and press [Enter]. The default value is 1.00, but values between 0.50 and 2.0 may be entered.

2.7.3a  Procedure Options

After completing the above steps, the XGF868i returns to the Channel PROGRAM window. Press [Escape] twice to return to the meter display. Then proceed to Chapter 3, *Operation*, for instructions on taking measurements, or refer to the *Programming Manual* for instructions on programming the XGF868i advanced features.
[no content intended for this page]
Chapter 3. Operation

3.1 Introduction

See Chapter 1, Installation, and Chapter 2, Initial Setup, to prepare the XGF868i system for operation. When the meter is ready to take measurements, proceed with this chapter. The following specific topics are discussed:

- Powering Up
- Using the Display
- Taking Measurements
- Recording Diagnostics

Note: All inputs and outputs of the XGF868i are calibrated at the factory, prior to shipment. If it becomes necessary to recalibrate any of the inputs and/or outputs, see Chapter 1, Calibration, of the Service Manual for instructions.

**WARNING!** To ensure the safe operation of the XGF868i, it must be installed and operated as described in this manual. In addition, be sure to follow all applicable local safety codes and regulations for the installation of electrical equipment.
3.2 Powering Up

Because the XGF868i does not have an ON/OFF switch, it will power up as soon as the connected power source is energized.

IMPORTANT: For compliance with the EU Low Voltage Directive (2006/95/EC), this unit requires an external power disconnect device such as a switch or circuit breaker. The disconnect device must be marked as such, clearly visible, directly accessible, and located within 1.8 m (6 ft) of the unit.

There are three methods for obtaining readings from the XGF868i:

- Built-in LCD display
- PanaView software on a computer
- Device to read the XGF868i analog output

At least one of the above display options must be installed in order to obtain flow rate readings from the meter.

Immediately upon power up the software version display appears. Then, the meter performs a series of internal checks, which take about 45 seconds, prior to displaying the flow rate data.

Note: If the XGF868i fails any of the internal checks (see Chapter 2, Error Codes, in the Service Manual), try disconnecting the power and then repowering the unit. If the meter continues to fail any of the internal checks, contact GE for assistance.

After successfully performing the internal checks, the XGF868i begins taking measurements and the software version display is replaced by a measurement mode display. Proceed to the appropriate section for instructions on using the LCD display and the PanaView display option.

Note: As a minimum, the system and pipe parameters (for each installed channel of a 2-channel meter) must be entered before the XGF868i can display valid data. Refer to Chapter 2, Initial Setup, for instructions.
3.3 The LCD Display

The components of the LCD display are shown in Figure 14 below, along with a typical mass flow rate readout.

As shown in Figure 14 above, the display screen includes the following information:

- Channel Number
- Flow Parameter
- Units of Measure
- Flow Rate Value

The example in Figure 14 above uses the default display settings. However, the first three items in the list above may be reprogrammed to display a variety of alternative choices. See the Programming Manual for detailed instructions on programming these parameters.

**Note:** The LCD backlight flashes to signal errors. If the backlight is off when an error is detected, the display is illuminated briefly; if the backlight is already on, the light is interrupted briefly. Error code messages may appear in the upper right corner of the LCD display. For information about these error codes and how to respond to them, refer to Chapter 2, Error Codes, in the Service Manual.

Proceed to the Taking Measurements section to use the XGF868i.
3.4 The Optional PanaView Display

The components of the PanaView text display appear in Figure 15 below, along with a typical flow rate readout.

![Figure 15: A Typical PanaView Text Display Pane](image)

As shown in Figure 15 above, the text pane includes the following information:

- Channel Number
- Flow Parameter
- Units of Measure
- Flow Rate Value

The example in Figure 15 above is typical, but the first three items in the list above may be reprogrammed to display a variety of alternative choices. See the next section for detailed instructions on programming these parameters.

**Note:** Error code messages may appear in the lower left corner of the PanaView text display window. For information about these error codes and how to respond to them, refer to Chapter 2, Error Codes, in the Service Manual.

Proceed to the Taking Measurements section to use the XGF868i.
3.5 Taking Measurements

The XGF868i is capable of displaying several different variables in a variety of formats. However, this manual discusses only the basic measurement displays using the LCD display or the PanaView display. Refer to Chapter 2, Displaying Data, in the Programming Manual for instructions on setting up alternate choices. Also, refer to the Programming Manual and the PanaView User’s Manual to use PanaView or the analog outputs to obtain the flow rate data.

3.5.1 Programming the LCD

Note: When you first initialize the XGF868i, the number of LCD parameters is set to OFF. You must program the LCD to display any measured parameters.

Through the Keypad Program, you can program the LCD display to display up to four variables in sequence. Complete the following steps to program the LCD display:

1. Power up the XGF868i and wait until it has initialized.
2. Press [Escape], [Enter], [Escape].
3. In the Keypad Program window, scroll to PROG and press [Enter].
4. In the PROG menu, scroll to GLOBL and press [Enter].
5. Scroll to I/O and press [Enter].
6. Scroll to LCD and press [Enter].
7. The window now asks for the # of LCD Parameters. Scroll to the desired number (from OFF through 1-4 and KEY) and press [Enter].

The OFF setting switches the measurement display off, while the KEY setting enables users to change the measurement display via the arrow keys, without accessing the Keypad Program. If you select KEY:

- To view a parameter other than the one currently displayed, press the [△] or [▽] keys to scroll through the various parameters.
- To scroll through the channel options on a two-channel XGF868i, press the [<] and [>] keys until you have reached the desired option.
3.5.1 Programming the LCD (cont.)

8. Scroll to the desired Channel option, as listed in Table 10 below.

<table>
<thead>
<tr>
<th>Table 10: Channel Options</th>

3.5.1 Programming the LCD (cont.)

Note: The measurement units that appear in these prompts are those selected in the GLOBL-SYSTM menu earlier in this section. Also, when differences in one channel's programming invalidate an output previously chosen for the other, the measurement defaults to the nearest selectable item in the parameter list.

The previous two prompts repeat until all of the specified # of LCD Parameters have been set up. When all of the display parameters have been set up, the meter returns to the Global I/O window. To leave the Keypad Program, press the [Escape] key three times.

After leaving the Keypad Program, the XGF868i will reset itself and will begin to display the parameters specified in this section. If more than one parameter was set up, each of the parameters will be displayed in sequence, with a pause of several seconds between display changes.

3.5.2 Using the LCD Display

To use the programmed LCD display for obtaining flow rate data, simply power on the XGF868i as described earlier in this chapter. Then, read the flow rate directly from the display, as shown in Figure 14 on page 43.

Note: See Chapter 2, Displaying Data, in the Programming Manual to customize the contents of the LCD display.
3.5.3 PanaView Display

Power up PanaView, establish communications with the XGF868i and enter the required startup parameters, as described in Chapter 2, Initial Setup. Then, proceed as follows:

**Note:** See Chapter 2, Initial Setup, in this manual and/or Chapter 1, Programming Site Data, in the Programming Manual for complete instructions on entering startup data via PanaView.

1. In PanaView, pull down the Output menu, as shown in Figure 16 below, and click on the Text Display option.

![Figure 16: The Output Menu](image)

**Note:** The Text Display window that appears after Step 1 is actually stacked on top of any previously opened windows (such as the Meter Browser window).

2. Using the Window menu, as described in the PanaView User’s Manual, arrange the open windows in the desired format. For this discussion, Figure 17 below shows the Text Display window in its maximized (full-screen) size.

![Figure 17: The Text Display Window](image)

3. The left pane of the Text Display window contains the standard PanaView network tree. Expand the XGM branch, and double-click on the desired channel. (On 2-channel units, you can also display the SUM, DIFF or AVG parameters.)
3.5.3 PanaView Display (cont.)

4. From the expanded tree, double-click on the desired flow parameter to display it in the right pane of the window.

5. Before actual data values can be displayed in the text pane, activate one of the following data collection modes (see Figure 17 on page 48):

   - Click on the [Get Once] option button at the bottom of the right pane in the Text Display window. The current value of the selected process parameter, as specified in the PanaView network tree, is displayed in the right pane of the Text Display window.

   or

   - Enter an “interval” in the text box at the bottom of the right pane in the Text Display window, or check the “Max. Comm Rate” box to collect readings as fast as the system allows (1 sec). Then, click on the [Continuous] option button to begin collecting data for display in the right pane of the Text Display window.

   Note: Any value entered in the “Interval” text box is overridden if the “Max. Comm Rate” box is checked.

   The right pane now appears similar to Figure 15 on page 44.

6. If the [Continuous] option was selected in Step 5, click on the [Stop] option button, which has replaced the original [Continuous] option button, to terminate data collection.

   The Text Display window may be left open while other tasks are performed, or it may be closed by clicking on the lower [X] control button at the far right of the menu bar.

   IMPORTANT: If you click on the upper [X] control button at the far right of the PanaView title bar, you will exit PanaView completely.
3.5.3a  Displaying Multiple Process Parameters

The procedure for displaying a single process parameter in a text screen may be repeated to simultaneously display multiple process parameters. To do so, proceed as follows:

1. Display the first process parameter in a text screen, as described in the previous section.
2. Repeat Step 1 for any desired additional process parameters, by double clicking on them in the PanaView network tree. PanaView automatically tiles the multiple text screens in the right pane of the Text Display window, as shown in Figure 18 below.

![Figure 18: Multiple Text Screens in the Text Display Window](image)

3. As in any standard Windows application, the multiple text screens may be resized by dragging their borders. Also, the individual panes within a parameter’s text screen may be resized by dragging the borders within that text screen.

4. To close an open text screen, right click anywhere within that screen (except in the title bar or the error section) and click on the [Remove] option that pops up in the context menu.

*Note:* After resizing or removing any of the multiple text screens, the default tiled layout may be restored by opening the Window menu (see the PanaView User’s Manual) and clicking on the Tile Output Displays option.

3.5.3b  Displaying Multiple Text Windows

The procedures for displaying one or more process parameters in a single Text Display window may be repeated to open multiple Text Display windows. To do so, proceed as follows:

1. To open another Text Display window and display the desired process parameter(s) in the new window, repeat the steps in PanaView Display.
2. Arrange the multiple Text Display windows as desired via the Window menu (see the PanaView User’s Manual).
3.5.4 Pausing Measurements

On occasion, it might become necessary for the XGF868i to stop taking measurements. Through PanaView, you can direct the XGF868i to pause measurements without cutting off the power from the meter.

1. From the meter tree in the New Meter Browser, click on the XGF868i entry.
2. Expand the Edit Functions option, and double-click on the Pause Measurement entry. A window opens similar to Figure 19 below.

![Pause Measurement Window](image)

3. To pause current measurements, double-click on the Stop measurement option. The window closes, and the XGF868i stops taking measurements.
4. To restart measurement, double-click on the Pause Measurement entry, and then on the Measure flow option. The XGF868i resumes flow measurement.

3.5.4a Procedure Options

The Startup Guide is intended to provide only those instructions necessary to get the XGF868i installed and operating. By following the instructions in this chapter, the XGF868i can be set up to display the desired channel option and the desired measurement parameter, using either the LCD display or PanaView. To utilize the more advanced capabilities of the XGF868i, refer to the Programming Manual and/or the Service Manual for the instrument. Also, refer to the PanaView User’s Manual for instructions on using the PanaView software with the XGF868i.
[no content intended for this page]
Chapter 4. Specifications

4.1 Operation and Performance

4.1.1 Fluid Types
Flare and vent gases

4.1.2 Pipe Materials
All metals, fiberglass (Consult GE for other materials)

4.1.3 Pipe Sizes
14 to 120 in. NB ANSI (350 to 3000 mm)

4.1.4 Flow Accuracy (Velocity)

4.1.4a High Flow Range: ±1.0 ft/s to ±394 ft/s (±0.3 to ±120 m/s)
   One-Path: ±2.0%
   Two-Path: ±1.5%
   Note: For 4 to 12 in. NB pipe sizes, accuracy ranges from 1.5 to 4% (consult GE for details). Accuracy to ±0.5% may be achieved with calibration.

4.1.4b Low Flow Range: ±0.1 ft/s to ±1.0 ft/s (±0.03 to ±0.3 m/s)
   One-Path: ±0.008 ft/s (±0.002 m/s)
   Two-Path: ±0.0057 ft/s (±0.0017 m/s)

Note: Accuracies listed assume a fully developed flow profile. A minimum straight pipe run of 20 pipe diameters upstream and 10 pipe diameters downstream from the measurement point are recommended. Also, consult GE for the accuracy of non-standard flow transducer types.

4.1.5 Molecular Weight Accuracy
±1.8% of reading for hydrocarbon mixtures with molecular weights of 2 to 120 gr/gr mole

4.1.6 Mass Flow Accuracy
   One-Path: ±2.7%
   Two-Path: ±1.9%
   Note: Dependent on the accuracy of the temperature and pressure inputs.
Chapter 4. Specifications

4.1.7 Repeatability

4.1.7a High Flow Range: ±1.0 ft/s to ±394 ft/s (±0.3 to ±120 m/s)
   One-Path: ±0.5 to 1.0%
   Two-Path: ±0.35 to 0.75%

4.1.7b Low Flow Range: ±0.1 ft/s to ±1.0 ft/s (±0.03 to ±0.3 m/s)
   One-Path: ±5 to 6%
   Two-Path: ±3.5 to 4.0

4.1.8 Rangeability (Overall)
   4000:1

4.2 Electronics

4.2.1 Flow Measurement
   Patented Correlation Transit-Time mode

4.2.2 Enclosures
   Standard: Epoxy-coated aluminum, Hazardous area ratings:
   Explosion-proof: Class I, Division 1, Groups B, C, D
   Flameproof: ISSeP 07ATEX015
                II 2 G Ex d IIC T5 IP66
   IECEEx: FM G 0011x
          II 2 G Ex IIC T6 Gb IP66
   Optional: Stainless steel

4.2.3 Dimensions (l x d)
   8.2 in. x 6.6 in. (208 mm x 168 mm)

4.2.4 Weight
   Aluminum: 10 lb (4.5 kg)
   Stainless steel: 30 lb (13.6 kg)
4.2.5 Channels

*Standard:* Two channels (for two-path averaging)

4.2.6 Display

2 line x 12 character backlit LCD display,
configurable to display up to four measurement parameters in sequence

4.2.7 Keypad

Built-in magnetic six-button keypad for full functionality operation

4.2.8 Power Supplies

*Standard:* 100 to 240 VAC, 50/60 Hz, ± 10%.

*Optional:* 12 to 28 VDC, ±5%.

4.2.9 Power Consumption

20 W maximum

4.2.10 Operating Temperature

−40°F to 140°F (−40°C to 60°C)

4.2.11 Storage Temperature

−67°F to 167°F (−55°C to 75°C)

4.2.12 Standard Inputs and Outputs

Two 0/4 to 20 mA isolated analog outputs, 600 Ω maximum load, and
Two 4 to 20 mA isolated analog inputs, 24 VDC loop power
or
One 4 to 20 mA isolated analog inputs, 24 VDC loop power, and
One direct three-wire RTD (temperature) input, -148°F to 662°F (-100°C to 350°C), 100 Ω platinum

4.2.13 Optional Inputs and Outputs

Two optically isolated frequency outputs, 3 A maximum, 100 VDC maximum,
1 W maximum, from DC to 10 kHz maximum
4.2.14 Digital Interfaces

*Standard:* RS232 (PanaView (PC software))
HART® protocol on 4-20 mA output

*Optional:* Modbus® TCP/IP
Ethernet
OPC Server
Foundation Fieldbus®

4.2.15 European Compliance

*System:* Directives EMC 2004/108/EC, LVD 2006/95/EC (Installation Category II, Pollution Degree 2)
*Transducers:* PED Directive 97/23/EC for DN<25

[See the CE Declaration of Conformity at the back of this manual.]

4.3 Wetted Ultrasonic Flow Transducers

4.3.1 Temperature Range

*Overall:* -364°F to 536°F (-220°C to 280°C)

*Note:* Transducer type selection is based on specific application review.

4.3.2 Pressure Range

*Standard:* 2 psig to 1500 psig (87.6 kPa to 10300 kPa)

4.3.3 Materials

*Standard:* Titanium

*Optional:* Monel® or Hastelloy® alloys

4.3.4 Process Connections

Flanged and compression fittings

4.3.5 Area Classifications

*Standard:* Epoxy-coated aluminum, Hazardous area ratings:

- **Explosion-proof:** Class I, Division 1, Groups C, D
- **Flameproof:** II 2 G Ex d IIC T4, T3 or T2 Gb
- **IECEX:** Ex d IIC T4, T3 or T2 Gb

*Optional:* Class I, Division 1, Group B
4.4 Insertion Mechanism

4.4.1 Standard Range
3 in. (76 mm) flange-mounted packing gland and valve with equal mounting angles upstream and downstream

4.4.2 Extended Velocity Range
3 in. (76 mm) flange-mounted packing gland and valve with *Recovery Angle* in downstream assembly

4.5 Preamplifier

4.5.1 Physical
In-line, powered preamplifier with transformer and BNC connections. One preamplifier with transformer is required per transducer per channel.

4.5.2 Gain
*Standard:* 20
*Optional:* 2, 10, 40 (factory selected)

4.5.3 Temperature Range
–40°F to 60°F (–40°C to 140°C)

4.5.4 Enclosure
*Explosion-proof:* Class I, Division 1, Groups C, D *(Optional:* Group B upon request)
*ATEX Flameproof:* II 2 G Ex d IIC T4, T3 or T2 Gb
*IECEx Flameproof:* Ex d IIC T4, T3 or T2 Gb
Chapter 4. Specifications

4.6 Transducer Cables

4.6.1 Standard (per Transducer pair)

- One pair of coaxial cables for transducer to preamplifier connections (if required),
  type RG62A/U, length 3m (10 ft)
- One pair of coaxial cables for preamplifier to XGF868i electronics,
  type RG62A/U, length 10 ft (3 m) to 1000 ft (330 m) maximum

4.6.2 Optional

  flame retardant, armored cable, cable glands

4.7 Options

4.7.1 PanaView™ PC-Resident Interface Software

Using the PanaView software, the DigitalFlow™ XGF868i flow transmitter communicates with a PC running a Windows® operating system through a serial interface. Features include site files, logs and other operations.

4.7.2 Installation Flowcells

  Flanged or plain-end spoolpiece, with hot tap or cold tap transducer connections

  Note: Consult with GE for the availability of transducers and flowcells for specific applications.

4.7.3 Pressure and Temperature Transducers

  Available upon request.
Appendix A. CE Mark Compliance

A.1 Introduction

For CE Mark compliance, the XGF868i flow transmitter must be wired in accordance with the instructions in this appendix.

IMPORTANT: CE Mark compliance is required for all units intended for use in EU countries.

A.2 Wiring

The XGF868i must be wired with the recommended cable, and all connections must be properly shielded and grounded. Refer to Table 12 below for the specific requirements. All interconnecting cables shall comply with IEC/EN 60079-14.

![Warning Icon]

**WARNING!** To ensure safe and reliable operation of the XGF868i, be sure to install and tighten all cable glands in accordance with the gland manufacturer’s instructions.

**Note:** If the XGF868i is wired as described in this appendix, the unit will comply with the EMC Directive 2004/108/EC.

Appendix C. Measuring P and L Dimensions

C.1 Introduction

When programming the PIPE menu in the XGF868i User Program, the path length (P) and the axial dimension (L) must be entered. These parameters are determined by measurements on the actual transducer installation, with P equal to the face-to-face distance between the transducers and L equal to the axial distance between the centers of the transducer faces.

The accuracy of the programmed P and L values is critical to precise flow rate measurements. If GE supplies the flowcell for the system, the correct values will be included in the documentation supplied with the system. For transducers installed on an existing pipe (see Figure 20 on page 68), P and L must be measured at the site. This appendix provides instructions for properly determining these dimensions.

C.2 Measuring P and L

Whenever possible, physically measure the face-to-face distance (P) and the axial distance (L) between the centers of the flat faces of the transducers. Refer to Figure 20 on page 68 for an illustration of the proper distances to measure, in a typical installation.

In some situations only one of the required distances can be directly measured. When this happens, a knowledge of the installation angle (θ) of the transducers, permits the second distance to be calculated from Equation C-1 below.

\[ \cos \theta = \frac{L}{P} \]  

(C-1)

As an example, assume that the transducer installation angle is known to be 45° and the L distance is measured to be 10.00 inches. Then, the P distance is calculated to be \( P = 10.00/0.707 = 14.14 \) inches.

With a Bias 90° transducer installation, it sometimes happens that the only known parameters are the transducer angle (θ) and the centerline distance between the transducer bodies (CL). In these cases, it is still possible to calculate P and L by combining Equation C-1 above with the additional Equation C-2 below (see Figure 20 on page 68):

\[ P = CL - 1.2 \]  

(C-2)

Standard GE 90° transducers have the face offset from the centerline of the body by 0.6 inches. Thus, a pair of transducers has a total offset of 1.2 inches, as indicated in Equation C-2. For example, suppose that the transducer installation angle is 30° and CL is measured to be 12.00 inches. Then, \( P = 12.00 - 1.2 = 10.80 \) inches and \( L = 10.80 \times 0.866 = 9.35 \) inches.
Appendix C. Measuring P and L Dimensions

C.2 Measuring P and L (cont.)

Warranty

Each instrument manufactured by GE Sensing is warranted to be free from defects in material and workmanship. Liability under this warranty is limited to restoring the instrument to normal operation or replacing the instrument, at the sole discretion of GE Sensing. Fuses and batteries are specifically excluded from any liability. This warranty is effective from the date of delivery to the original purchaser. If GE Sensing determines that the equipment was defective, the warranty period is:

- one year from delivery for electronic or mechanical failures
- one year from delivery for sensor shelf life

If GE Sensing determines that the equipment was damaged by misuse, improper installation, the use of unauthorized replacement parts, or operating conditions outside the guidelines specified by GE Sensing, the repairs are not covered under this warranty.

The warranties set forth herein are exclusive and are in lieu of all other warranties whether statutory, express or implied (including warranties of merchantability and fitness for a particular purpose, and warranties arising from course of dealing or usage or trade).

Return Policy

If a GE Sensing instrument malfunctions within the warranty period, the following procedure must be completed:

1. Notify GE Sensing, giving full details of the problem, and provide the model number and serial number of the instrument. If the nature of the problem indicates the need for factory service, GE Sensing will issue a RETURN AUTHORIZATION NUMBER (RAN), and shipping instructions for the return of the instrument to a service center will be provided.

2. If GE Sensing instructs you to send your instrument to a service center, it must be shipped prepaid to the authorized repair station indicated in the shipping instructions.

3. Upon receipt, GE Sensing will evaluate the instrument to determine the cause of the malfunction.

Then, one of the following courses of action will then be taken:

- If the damage is covered under the terms of the warranty, the instrument will be repaired at no cost to the owner and returned.
- If GE Sensing determines that the damage is not covered under the terms of the warranty, or if the warranty has expired, an estimate for the cost of the repairs at standard rates will be provided. Upon receipt of the owner’s approval to proceed, the instrument will be repaired and returned.
Installing GE Measurement & Control Ultrasonic Flow Transmitters in a Potentially Hazardous Area

When installing this apparatus in a potentially hazardous area, the following requirements must be met:

- The installation shall comply with IEC 60079-14.
- Apparatus Markings:
  Ex d IIC T6 Gb
- Supply connection wiring shall be rated at least 10°C above rated ambient temperature of 60°C. Cable entries are 3/4” NPT.
- Certificate Number: IECExFMG12.0011X
  Complies with IEC 60079-0: 2011 and IEC 60079-1: 2007
  Manufacturer: GE Infrastructure Sensing, Billerica, MA.
- The certification covers the following GE product types — XMT868, XMT868i, XGF868, XGF868i, XGN868, XGN868i, XGS868, XGS868i, XGM868, XGM868i, IGM878 &: IGM878i.
- This apparatus is equipment category 2 and may be employed in Zones 1 and 2. It may not be employed in a Zone 0 area. This apparatus is certified for gas hazards only.
- Enclosure Material: Si=95, Mg=0.35%, Mn=0.5%, Al = remainder.
- This apparatus must be securely mounted using the mounting fixtures provided on the enclosure.
- All covers are fitted with a locking device. This device must be tightened after the cover is replaced so as to preserve the protection offered by the enclosure.
- Modifications to the flameproof enclosure are not permitted.
- Cable glands of an approved flameproof design are required. These must be installed according to the manufacturer’s instructions. Where the cable glands are provided by GE Sensing, the manufacturer’s instructions, as supplied to GE Sensing, will be included in the documentation.
- Connecting cable shall be mounted securely and protected from mechanical damage, pulling and twisting.
- Unused entries must be sealed using a certified threaded plug.
- The apparatus should be de-energized before opening.
- If live working is necessary, the apparatus may only be opened when the surrounding atmosphere is known to be safe. Measures must be taken to ensure that it remains safe while the unit is open, such as a system of hot work permits.
- The apparatus uses standard printed circuit assemblies. Always quote the apparatus serial number when ordering spares.
- This flameproof apparatus is only designed to be installed in a potentially hazardous area. This apparatus has not been designed for use in a safe area, where it would be subject to CD 2006/95/EC (LVD). For a safe area installation, an external mains disconnect must be provided close to this apparatus. If in doubt, consult GE.

Certification & Safety Statements for GE Measurement & Control Ultrasonic Flow Transmitters

When installing this apparatus, the following requirements must be met:

- Field wiring shall be rated at least 10°C above 70°C.
- Connecting cables shall be mounted securely and protected from mechanical damage, pulling and twisting.
- Cable entries are ¾” NPT.
- Cable glands of an approved flameproof design are required. These must be installed according to the manufacturer’s instructions. Where the cable glands are provided by GE, the manufacturer’s instructions, as supplied, to GE, will be included in the documentation.
- Unused cable entries must be sealed using a certified threaded plug.
- Modifications to the flameproof enclosure are not permitted.
- The apparatus should be de-energized before opening.
- Installation should comply with IEC/EN 60079-14.
- The product contains no exposed parts which produce surface temperature infrared, electromagnetic ionizing, or non-electrical dangers.
- The product must not be subjected to mechanical or thermal stresses in excess of those permitted in the certification documentation and the instruction manual.
- The product cannot be repaired by the user; it must be replaced by an equivalent certified product. Repairs should only be carried out by the manufacturer or by an approved repairer.
- Only trained, competent personnel may install, operate and maintain the equipment.
- The product is an electrical apparatus and must be installed in the hazardous area in accordance with the requirements of the EC Type Examination Certificate. The installation must be carried out in accordance with all the appropriate international, national and local standard codes and practices and site regulations for flameproof apparatus and in accordance with the instructions contained in the manual. Access to the circuitry must not be made during operation.

Special Conditions for Safe Use: Consult the manufacturer if dimensional information on the flameproof joints is necessary.

Markings: Markings shall appear on the product as shown below:
We, GE Sensing
1100 Technology Park Drive
Billerica, MA 01821
USA

declare under our sole responsibility that the

DigitalFlow™ XGF868i Ultrasonic Flare Gas Flow Transmitter
DigitalFlow™ XGM868i Ultrasonic Gas Flow Transmitter
DigitalFlow™ XGN868i Ultrasonic Natural Gas Flow Transmitter
DigitalFlow™ XGS868i Ultrasonic Steam Flow Transmitter
DigitalFlow™ XMT868i Ultrasonic Liquid Flow Transmitter
DigitalFlow™ IGM878i Ultrasonic Industrial Gas Flow Transmitter

to which this declaration relates, are in conformity with the following standards:

- EN 60079-0: 2009
- EN 60079-1: 2007
- II 2 G Ex d IIC T5; ISSeP07ATEX015 (ISSeP, B7340 Colfontaine, Belgium - NoBo 492)
- EN 61326-1: 2006, Class A, Annex A, Continuous Unmonitored Operation
- EN 61010-1: 2012, Overvoltage Category II

following the provisions of Directives 2004/108/EC EMC and 94/9/EC ATEX.

Where products were initially assessed for compliance with the Essential Health and Safety Requirements of the ATEX Directive 94/9/EC using earlier harmonized standards, a subsequent review has determined that “technical knowledge” is unaffected by the current harmonized standards listed above.
